Track Hawk Fuse Cover Instructions

CLEAN your Fuse cover with acetone, brake cleaner or any other alcohol based cleaner then rough it up slightly with the provided sand paper. Clean off the plastic dust off again with Acetone before the install. It is difficult to get an adhesive to stick to this surface but if it's cleaned and roughed it will work perfectly.

You need more Velcro on the fuse cover than you do the actual billet cover. The preferred way to install the billet cover is to mark the plastic fuse cover and install the longer strips first. If that is the case, mark the plastic with a sharpie marker by aligning the cover left to right and raising it so you can see the proper attachment points. Install the provided strips from front to rear and press them in as hard as you can and hold for 15 seconds on each one. Press your cover onto the fuse cover and push gently and it will snap in place. It doesn't matter if the Velcro isn't 100% aligned. It is extremely strong and will hold you cover on until you want to remove it. Your cover is now ready to be removed as many times as needed.
